

FAIRLIGHT

User Manual

Introduction

Welcome to AudioBase3 ! With AudioBase3, multiple Fairlight users can share sound libraries, music libraries and other sound files. With the advanced AudioBase3 search engine, searching **HUGE** sound file databases is *blazingly* fast, and advanced search tools allow users to find *exactly* what they need quickly and easily. AudioBase3 also includes a friendly web interface, so users can search for sound files from their desktop – no workstation required!

AudioBase3 exists in two configurations:

AudioBase3 Basic

AudioBase3 Basic is included FREE with every new Fairlight installation, and works with the FREE Apache2 webserver and FREE MySQL database. AudioBase3 Basic includes the following features:

- Completely new engine offers superior performance, especially with large datasets
- Allows creation of centralized shared libraries via a central Server
- Enables facility-wide library management from any Fairlight controller
- Provides basic web search capability
- Support for Internet Information Services (IIS) **and** Apache2 webservers (Apache2 is a FREE download).
- Support for Microsoft SQL Server (2000 & 2003) **and** MySQL databases (MySQL is a FREE download).
- Runs under Windows XP Professional or Windows Server 2003

AudioBase³xreme

AudioBase3 Extreme is the enhanced version of AudioBase3. AudioBase3 Extreme includes all the features of AudioBase3 Basic, *plus* the following advanced features:

- Integrates with Apple's iTunes, allowing direct ripping/publishing to AudioBase3 with automatic metadata lookup
- Metadata acquired from iTunes is automatically embedded in the WAV file, providing compatibility with other systems (eg – DigiBase, NetMix).
- Supports direct scanning and publishing of compatible WAVs (including Multi-channel files), AIFF, and MP3 files, including metadata extraction. This allows libraries created on other systems (eg – NetMix, SoundMiner) to be used by AudioBase3 Extreme.
- Files ripped via iTunes or scanned with AudioBase3 Extreme can be searched/played/downloaded via the web interface. This allows other systems on the network to use the AudioBase3 Extreme library
- "Picklists" of files ripped via iTunes can be created using the AudioBase3 Extreme web interface, then opened directly on Fairlight systems (ML4). This allows music and sfx searches to be performed outside of the studio environment, maximizing productivity.
- Provides web-based library management

AudioBase3 Extreme is designed from the ground up to be a "good neighbour" to other systems, and to maximize productivity in busy studio environments. With AudioBase3 Extreme, facilities can quickly and easily leverage their existing audio CD, BWF/WAV, AIFF or MP3 libraries. With web-based picklist generation, spotting or pre-production can be performed from any PC or Mac on the network, without tying up valuable studio time. AudioBase3 Extreme is ideal choice for the **serious** studio.

System Requirements

HARDWARE ...

ENTRY LEVEL CONFIGURATION

Pentium IV 2.5 Ghz (or higher), 512MB RAM (minimum), dedicated 10GB library drive (minimum)

MIDRANGE CONFIGURATION

Pentium IV 3.0 Ghz (or higher), 1GB RAM (minimum), dedicated 50GB library drive (minimum)

HIGH END CONFIGURATION

Pentium IV XEON 3.0 Ghz (or higher), 1.5GB RAM (minimum), dedicated 100GB RAID5 library drive (minimum)

SOFTWARE ...

OPERATING SYSTEM

Windows XP Professional SP2 (minimum)

–or–

Windows Server 2003 SP1 (minimum)

WEB SERVER & DATABASE

FREE Apache 2.x webserver (minimum) & FREE MySQL 4.1.x database (minimum)

-or-

Microsoft IIS 6.x webserver (minimum) & Microsoft SQL Server 2003 database (minimum)

*Note: Other webserver & database combinations may work, but are not supported.

AudioBase3

Setting up AudioBase3 on Fairlight

Each Fairlight system needs to map AudioBase3 server drives to the local PC. To do this, select 'Map Network Drive' from the Windows Explorer 'Tools' menu. Map the desired drive as shown below:

If necessary, enter a password for the network drive.

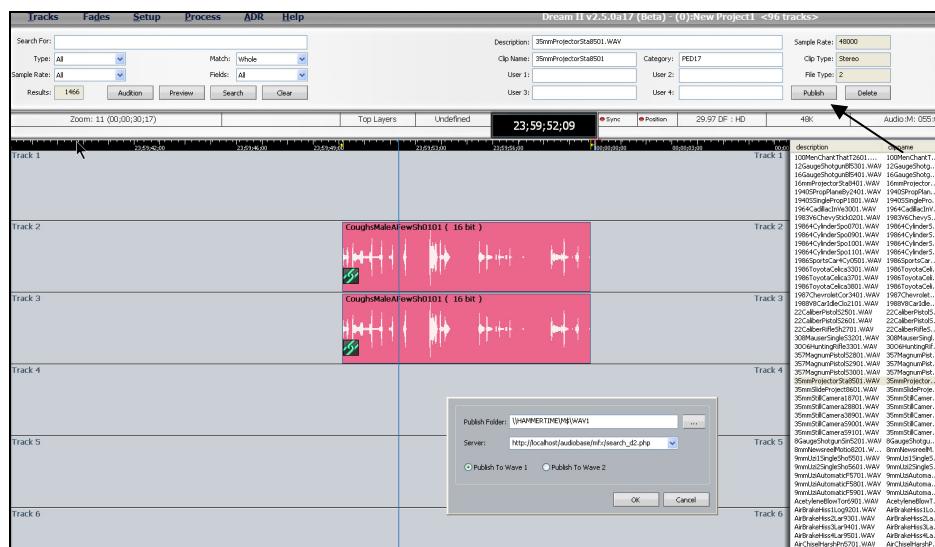

After mapping your AudioBase3 server drives to your PC, make sure to set the network drive as a Media device in the Setup/Media and project Management menu.

Finally, enter your AudioBase3 Server details in Setup/General Preferences. Example:

http://192.168.1.100/AudioBase/MFX/search_d2.php (Where 192.168.2.100 is the IP Address of your Server).

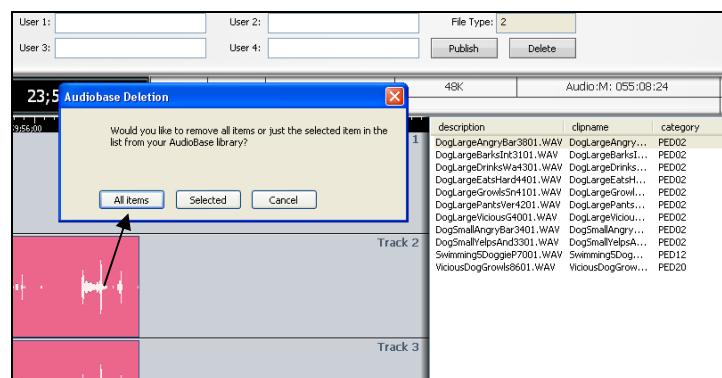

Publishing Clips

To Publish clips in, simply highlight the desired clips and click the 'Publish' button in the AudioBase Smart Pane. You will see a popup asking you to select the AudioBase WAV1 or WAV2 folder. If you have multiple audiobase servers on your network, you can also select which server you would like to publish to. Select the desired server and destination folder, and all highlighted clips will be exported to the specified AudioBase server as WAV files and published into AudioBase3.

Deleting AudioBase Clips

To delete AudioBase clips, first perform a search to find clip(s) that you wish to delete. When the search results are displayed, select the item in the results list you wish to delete, then click the 'Delete' button in the AudioBase Smart Pane.

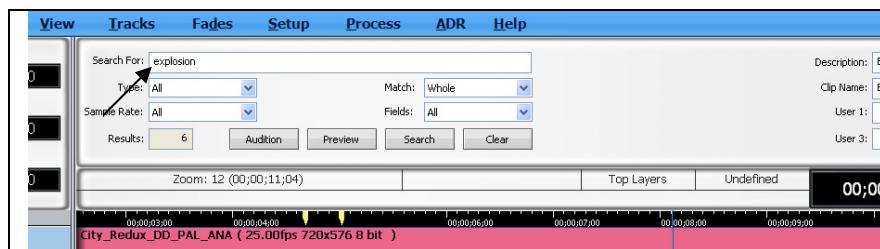

You may also use the option to delete "All items" that are shown in the results list.

* Note: Deleting a clip from AudioBase only removes the clip reference from the database. Please use Windows Explorer if you wish to delete the associated audio file (s).

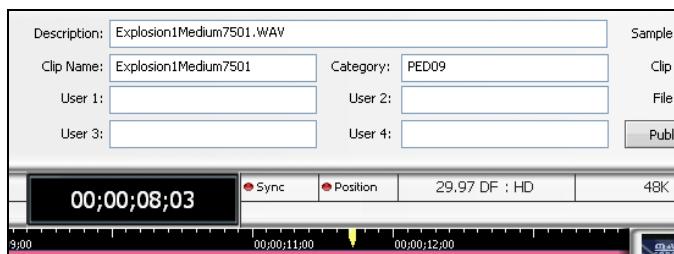

Searching for Sounds

AudioBase3 uses a simple search interface to find clips:

- Step 1 Press the **AudioBase** key on your controller to activate AudioBase mode.
- Step 2 Press the {Clear} soft key if necessary to clear previous searches.
- Step 3 Press the {Search} soft key. The search field becomes active.
- Step 4A Enter the text you wish to find. By using this "Search For:" box ... **All** relevant database fields will be searched. This global search field will always override others. Use quotes to find matching phrases.

- Step 4B You may also search for sounds using individual fields, such as <Description>, <Clip Name>, <Category> ... etc.

Simply type information into one or more fields, then press ENTER, and AudioBase will find all Clip Records matching your Search Criteria. For example, if you type FISH into the Clip Name field and press ENTER, all clips named FISH will be listed at the right of the screen. If Match is set to START, all clips whose names start with FISH will be listed.

You may enter data into any field. If you leave a field blank, all Clip Records will match it - it's like saying you don't care what is contained there. If you enter data into more than one field, the search may be instructed to find Records which match ALL of the fields, or ANY of the fields, depending on the status of Match in the options submenu. For example you enter WIND in the clip name field, and LOUD in the description field. When Match is set to ALL, the search will find all clips with WIND contained in their names which also have LOUD contained in their descriptions.

You might want to set Fields to ANY when you are looking for any reference to a concept. For example you might enter DOG into both the name and description fields and find all Clip Records containing DOG in either field. When searching in the Description field, each word in the field is considered separately.

AudioBase will find search each word, and return all Records where one or more words match the criteria. For example, you place the letters "dog" in this field - when Match is set to PART, AudioBase returns a Record if any word in the description contains "dog" - when set to WHOLE it returns a Record if any word in the description is "dog".

Additional Search Conditions

Additional search parameters can be added to both global and field searches. These are as follows:

- * **ANY**
This asterix places an (ANY criteria) in the search text. The asterix can be replaced by any number of characters. For example, typing *squeak would enable the listing of mouse squeak and door squeak.
- = **ANY ONE**
This equal sign (=) placed in the search text is used to replace any one character.
- ? **ONE OR NONE**
This question mark (?) placed in the search text is used to replace any one character or no character.
- & **AND**
An ampersand (&) is placed in the search text is used to add another name. Only clips with names containing both search names will be listed. For example, typing *door&*squeak would list only the clips with names including both door and squeak. This will list door squeak but not mouse squeak or door slam.
- | **OR**
A bar (|) is placed in the search text to add another name. Clips with names containing either search string will be listed. For example, typing *door|*slam will list clips with names containing door as well as clips with names containing slam. This will list door squeak and door slam but not mouse squeak.
- ~ **NOT**
A tilde (~) is placed in the search text to add another name. This will exclude the specified text. For example, typing *door&~squeak would list the clips with names including door except those also containing squeak. This will list door slam but not door squeak.

Placing Sounds In A Project

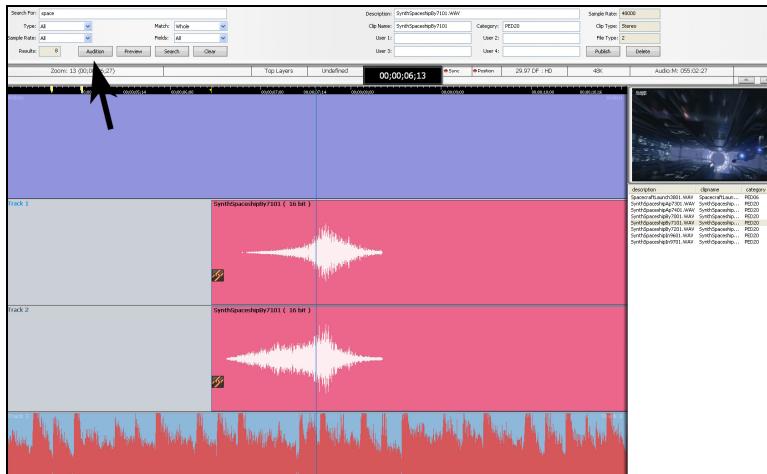

- Step 1 After searching the database, a list of matching clips is displayed. Ensure the transport is in **STOP**, then use the jogger wheel, + and – keys or up and down arrow keys to highlight the clip you want. You may also use a mouse to click and select.
- Step 2 Press the `{Preview}` soft key or the 'Preview' button in the Smart Pane. If Preview is lit, the highlighted audio file in the list will loop repeatedly.
You can use the Jogger wheel, the + and – keys, or the mouse to select different sounds in the list.
- Step 3A Double-Click the selected file to paste it at the playhead on the active track, or drag and drop a clip to any track at any point on the timeline.
- Step 3B You may also use the <Audition> function. Before using AudioBase to import a clip, park the transport at the sync point in your Project. This can even be done with a 9 pin machine online. Press the AUDITION soft key. This will play the clip using the currently selected track. When auditioning, the Project remains stationary. If necessary, use the transport keys (including **Jog** and **Jump**) to position the clip at the desired sync location. Press the `{Paste}` soft key to place the clip in the Project.

More About Audition

While Audition is on, only the Auditioned Clip can be heard. The other clips on the screen do not move, and displayed in ghost mode to provide a visual reference for positioning the clip you are auditioning. To regain normal transport control, turn Audition OFF. This will cause the Auditioned Clip Record to disappear, and the Project to reappear as normal. Turning Audition ON again will start playing the current Clip Record from its Head.

To hear a different Clip Record, use the + and – keys or the Jogger Wheel to scroll the list, or use the mouse to select another sound, then turn Audition Off and On again.

While Audition is on, the Timecode on the video screen displays the elapsed play time of the Current Record, but the Project Timecode position does not change.

Notes:

- The AudioBase3 results pane can be displayed underneath the Pyxis Track, allowing easy placement of sounds to picture.
- To hide the AudioBase3 results list, simply enter another mode (e.g. Cut).
- Double Byte character sets (Japanese, Chinese, Korean, etc) are now supported. *Please Note*. The server Operating System must be the native version to support the desired language (eg – Japanese Windows for Japanese AudioBase, Korean Windows for Korean AudioBase, etc)

Using the Browser Interface

To access AB3 from a “remote” PC type: <http://X.X.X.X/audiobase/> - the IP address being that of the Sound Effects Server.

Search AudioBase3 for clips or projects

Click 'Play' to play WAV files that have been scanned or published from iTunes. *Note: if a 'Play' link does not appear, the file is missing or has moved from its original location.

Publish iTunes CDs to AudioBase3

If your AudioBase3 installation has been configured accordingly, you can use iTunes to rip CDs and publish the iTunes metadata into AudioBase3. **Please be aware that the Server must be connected to the Internet for this to work. Fairlight suggests that you use a separate protected network card (firewall) to accomplish this.**

Just follow these steps:

- Rip the desired CD using iTunes.
- Select desired CDs and click 'Add CDs to AudioBase3'.

File and Folder names are automatically 'cleaned' (illegal characters are removed) and truncated to the correct length for QDC compliance.

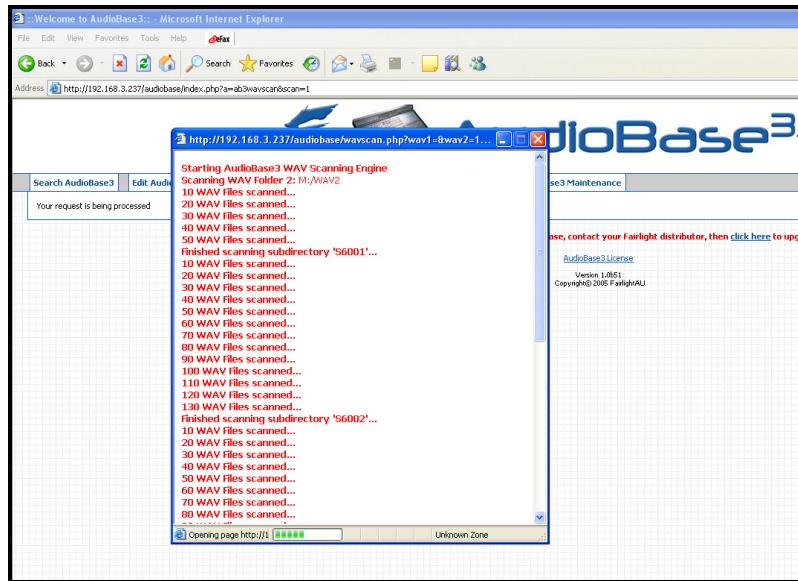

New iTunes WAVs from the selected CD(s) are added to AudioBase3. If identical WAVs have already been published, duplicates are ignored. iTunes info is automatically embedded directly into the WAV file, and other AudioBase3xtreme users can automatically load the embedded data using the 'Scan WAV files' menu. Other third party database systems may also be able to read the embedded data.

Warning closing the iTunes popup window will abort the publishing process, and may corrupt your AudioBase!

Scan WAV, AIFF, MP3 files into AudioBase3

If your AudioBase3 installation has been configured accordingly, you can scan WAV, AIFF and MP3 files placed in your WAV1 and WAV2 folders into AudioBase3. Just follow these steps:

- Copy or move the desired WAV, AIFF, or MP3 files into your Server's WAV1 or WAV2 folder. You can have as many subfolders as you wish.
- Select desired folder(s) and click 'Add Files to AudioBase3'.
- New files from the selected folder(s) are added to AudioBase3. If identical files have already been published, duplicates are ignored.

How metadata is scanned into AudioBase3

- If Fairlight metadata is found in any WAV file, Category, User1 and Description information is restored automatically.
- If third party metadata is found in any WAV file, it is placed in 'Description', and the name of the folder/subfolder where the WAV resides is placed in 'Category'.
- If an ID3 tag is found in an MP3 file, 'Title - Genre' is placed in 'Description', 'Album' is placed in 'Category' and 'Artist' is placed in 'User1'.
- Otherwise, the filename is placed in 'Description' and the name of the folder/subfolder where the file resides is placed in 'Category'.

Note:

If the AudioBase File Scanner tries to rename a file and the new name is already in use in the same folder, a warning will be displayed and the file will be skipped. To fix, manually rename each skipped file with a unique name and rescan.

Warning closing the WAV Scanner popup window will abort the publishing process, and may corrupt your AudioBase!!

Create/Manage Picklists

If your AudioBase3 installation has been configured accordingly, you can create 'Picklists' of sound files you've published from iTunes or scanned in the 'Scan WAV Files' menu. These Picklists can then be used to generate an ML4 file on your SFX server. Just follow these steps:

Select an existing Picklist or create a new one.

For new Picklists, enter a Picklist Name, Mark Name, Frame Rate, Start Time, Stereo Track, Mono Track, Description (optional) and Sample Rate. Once you've selected or created a Picklist, use the Picklist search tool to find, play, add and delete clips. The clips you select will remain checked.

- Click 'Show Current Picklist Contents' to view/play/delete clips in the current picklist.
- Click 'Delete' to permanently delete the current picklist.
- Click 'Generate ML4' to create an ML4 file.
- Click 'Start Over' to return to the select/add Picklist menu.

The screenshot shows the Audiobase3 software interface in Microsoft Internet Explorer. The title bar reads "Welcome to Audiobase3 - Microsoft Internet Explorer". The main window displays a list of audio clips in a table format. The columns are labeled: Play, Add, Clip Name, Category, Description, User 1, User 2, and Del. The table contains 15570 matches. The first few rows of data are as follows:

Play	Add	Clip Name	Category	Description	User 1	User 2	Del
<input type="checkbox"/>	<input type="checkbox"/>	*01Hey Lover	The No1 Rap Album Disc.2	Hey Lover	Various		<input type="checkbox"/>
